

Architecture Driven by Empathy: The Haiyin Wealth Transformation

How IBM Garage translated human
frustration into a scalable AI Label
Management Platform.

The Friction of Fragmented Wealth Management

Haiyin Wealth Management possessed immense market potential, but their internal operations were hindered by severe digital fragmentation. A sprawling organization relied on disconnected systems, resulting in repetitive manual work, isolated data islands, islands, and a compromised customer experience.

The Result: Information asymmetry where the middle and back offices cannot effectively support the frontline sales force.

The Stakeholder Orbit: A Complex Ecosystem

When data is siloed, the Wealth Planner flies blind. A fragmented ecosystem means Marketing pushes irrelevant campaigns, Call Centers lack context during inquiries, and the Client experiences a disjointed brand.

The IBM Garage Methodology: Empathy at Scale

1. Understand the Business (Discovery)

Conduct deep-dive interviews across 9 departments (IT, Marketing, Call Center, Operations, etc.) to map core processes and identify raw pain points.

2. Design Thinking Workshops (Synthesis)

Facilitate targeted workshops with 5 core groups to construct empathy maps, chart user journeys, and define exact data gaps.

3. Data & Platform Preparation (Execution)

Translate qualitative findings into quantitative label architectures and deploy the IBM Cloud Pak for Data (CP4D) platform.

Listening to the Organization

25

Unique Human Pain
Points Extracted

The primary revelation from the frontline: An overwhelming demand for unified, accurate Client Personas and Wealth Planner Profiles. The business didn't need more software; it needed a unified view of its people.

The Convergence of Friction

The Critical Failure Point:
Matching the right Product to
the right Client through the
right Planner is impossible
without unified data.

The Persona Triad: Diagnostic & Target Capabilities

Persona	The As-Is Pain	The To-Be Digital Capability
The Client Persona	Data scattered across apps; high churn risk; manual reporting.	Maximize data asset retention; AI-driven churn prediction; targeted event/product recommendations based on behavior.
The Wealth Planner Persona	Blind to client history; overwhelmed by generic corporate marketing; manual tracking.	Precision marketing support from the middle-office; automated KPI tracking; tailored product matching for their specific client base.
The Product Persona	Inability to track external product performance or align with current market trends.	Holistic view of product lifecycle; ability to design online/offline campaigns mapped directly to product attributes.

The Synthesis Funnel: From Emotion to Schema

The Data Evolution Matrix

Current Existing Data (The Baseline)

- Siloed CRM inputs
- Basic demographic info
- Isolated transaction records
- Dormant account lists

The Missing Internal Data (The Gap)

- Comprehensive cross-product ROI
- Event participation history
- Holistic family wealth profiles
- Point-redemption behaviors

The Future External Data (The Edge)

- External platform behaviors (Douyin, Toutiao)
- Comprehensive risk profiles
- Competitor product affinity
- Off-platform engagement metrics

Takeaway: To build a true 360-degree persona, Haiyin must transcend basic CRM inputs and integrate behavioral and external lifecycle data.

The Architectural Synthesis

How do we solve 25 unique human pain points across 9 different departments without building 25 different applications?

A single, intelligently calculated **Tag** (e.g., 'High-Value Churn Risk') acts as a universal solvent for departmental friction.

Breaking the IT Bottleneck

The Legacy IT Bottleneck

Result: Slow, rigid, requires constant developer intervention.

The Modern Middle Office

Result: Rapid, self-service insights based on pre-calculated personas.

The Data Refinement Engine

The Hive of 360° Insight

By standardizing data into interlocking labels, we transform scattered interactions into a living, unified enterprise persona. The Hive scales effortlessly as new data sources are introduced.

Powered by IBM Cloud Pak for Data

1. Foundation

Deployment of IBM CP4D AI & Data platform (ETL, Data Warehouse scheduling).

2. Architecture

Label system design, development, and deployment (including data asset mapping and quality reporting).

3. Application

Client persona and customer segmentation deployment.

4. Evolution

Continuous iteration of the digital platform and label system through machine learning and knowledge transfer.

Key Takeaway: A fully integrated, enterprise-grade AI environment that handles everything from raw data ingestion to advanced machine learning models.

Empathy Operationalized

The Haiyin Wealth transformation proves that successful digital middle-office design cannot happen in an IT vacuum. By deeply understanding the daily friction experienced by Wealth Planners and Clients, IBM Garage engineered a data architecture that doesn't just store information—it anticipates human needs.

Human-Centric Discovery

25 pain points distilled into a unified strategy.

Intelligent Synthesis

Moving from fragmented apps to a centralized Label Management System.

Scalable Architecture

Powered by IBM CP4D, ready to adapt to future market demands.

From chaotic silos to a unified Hive: Driving wealth management forward through structured insight.
